MODULARIZING A COMPUTER PROGRAM FOR TESTING AND DEBUGGING

5   ABSTRACT

A system and method for facilitating and simplifying testing
and debugging of computer programs. is described   A computer
program is broken down to smaller components, such as, classes,
functions, or objects, and then those smaller components are
10   tested individually.   Accordingly, specific aspects of the
computer program can be effectively tested.   The user can
automatically perform a range of tests on a class or method when
the class or method is compiled without integrating the class or
method into a larger project.
